

E-Commerce Sales Performance Analysis and Dashboard Development Using Power BI

Prepared By: Dhanalakshmi

Tool Used: Microsoft Power BI Desktop Version

Project Type: Data Analytics & Business Intelligence Project

Project Summary

This project focuses on analyzing e-commerce sales performance using Microsoft Power BI. The objective is to transform raw sales data into meaningful business insights through data cleaning, modeling, DAX calculations, and interactive dashboard development. Multiple visualizations were created to evaluate sales performance, profitability, customer trends, and geographical distribution of sales. The dashboard enables stakeholders to make data-driven decisions by identifying high-performing categories, profitable products, and regional sales opportunities.

Project Objectives

- Analyze overall sales performance.
- Compare actual sales against targets.
- Identify profitable categories and sub-categories.
- Monitor monthly sales trends.
- Evaluate geographic sales performance.
- Build an interactive business dashboard.
- Apply DAX calculations for advanced analysis.

Dataset Description

Dataset	Description
List of Orders	Customer details, city, state, order date
Order Details	Sales amount, quantity, profit, category
Sales Target	Monthly category-wise sales targets

Software & Tools Used

Tool	Purpose
Power BI Desktop	Dashboard Development
Power Query	Data Cleaning
DAX	Calculations & Measures
Excel/CSV Files	Data Source

Data Cleaning Process

1. Imported CSV files.
2. Checked for missing values.
3. Removed blanks.
4. Applied Trim transformation.
5. Standardized text capitalization.
6. Verified data types.
7. Validated data quality.

The screenshot displays the Power Query Editor window. The main area shows a table with the following data:

Order ID	Order Date	CustomerName	State	City
B-25601	01-04-2018	Bharat	Gujarat	Ahmedabad
B-25602	01-04-2018	Pearl	Maharashtra	Pune
B-25603	03-04-2018	Jahan	Madhya Pradesh	Bhopal
B-25604	03-04-2018	Divisha	Rajasthan	Jaipur
B-25605	05-04-2018	Kasheen	West Bengal	Kolkata
B-25606	06-04-2018	Hazel	Karnataka	Bangalore
B-25607	06-04-2018	Sonakshi	Jammu And Kashmir	Kashmir
B-25608	08-04-2018	Aarushi	Tamil Nadu	Chennai
B-25609	09-04-2018	Jitesh	Uttar Pradesh	Lucknow
B-25610	09-04-2018	Yogesh	Bihar	Patna
B-25611	11-04-2018	Anita	Kerala	Thiruvananthapuram
B-25612	12-04-2018	Shrichand	Punjab	Chandigarh
B-25613	12-04-2018	Mukesh	Haryana	Chandigarh
B-25614	13-04-2018	Vandana	Himachal Pradesh	Simla
B-25615	15-04-2018	Bhavna	Sikkim	Gangtok
B-25616	15-04-2018	Kanak	Goa	Goa
B-25617	17-04-2018	Sagar	Nagaland	Kohima
B-25618	18-04-2018	Manju	Andhra Pradesh	Hyderabad
B-25619	18-04-2018	Ramesh	Gujarat	Ahmedabad
B-25620	20-04-2018	Sarita	Maharashtra	Pune

The right sidebar shows the 'APPLIED STEPS' list, which includes: Source, Promoted Headers, Changed Type, Filtered Rows, Cleaned Text, Trimmed Text, Cleaned Text1, and Capitalized Each Word.

Data Modeling

A one-to-many relationship was created between the List of Orders table and the Order Details table using the Order ID field. This relationship allows Power BI to connect order information such as city and state with sales transaction details, enabling accurate calculations and visualizations across multiple tables.

- One-to-many relationship.
- Primary key: Order ID.
- Cross-filter direction.
- Importance of relationships.

A calculated column named Revenue per Order was created using DAX. The formula multiplies the Amount by Quantity for each transaction to calculate the total revenue generated per order. This metric helps evaluate the financial contribution of individual orders.

Sales Category Calculated Column

Sales Category = IF('Order Details'[Amount] > AVERAGE('Order Details'[Amount]), "Above Average", "Below Average")

Table: Order Details (1,500 rows) Columns: Sales Category (2 distinct values)

The Sales Category column was created using a conditional DAX expression. Each transaction amount is compared with the average sales amount of the dataset. Transactions above the average are classified as "Above Average", while transactions below the average are classified as "Below Average". This helps identify high-performing and low-performing sales records.

Order Count measure created

A measure named Order Count was created using the DISTINCTCOUNT function. Unlike calculated columns, measures do not create a new field for each row. Instead, they perform dynamic calculations when used in visualizations. This measure returns the total number of unique orders in the dataset.

- Order Details
 - Amount
 - Average Profit Delhi
 - Category
 - Category Type
 - Order Count
 - Order ID
 - Profit
 - Quantity
 - Revenue per Order
 - Sales Category
 - Sub-Category
 - Sales target

A DAX measure named Average Profit Delhi was created using the CALCULATE and AVERAGE functions. The measure applies a filter to include only orders from Delhi and then computes the average profit. This demonstrates how DAX can perform location-specific business analysis.

YTD Sales Measure

A Date Table was created using the CALENDAR function. The table automatically generates all dates between the minimum and maximum order dates in the dataset. This table is required for implementing time intelligence calculations such as Year-to-Date (YTD) sales analysis.

The screenshot shows the Power BI Desktop interface. The 'Table tools' ribbon is active, with the 'Name' field set to 'Date Table'. The 'Structure' pane shows the table's DAX formula:

```
1 Date Table =  
2 CALENDAR(  
3 MIN('List of Orders'[Order Date]),  
4 MAX('List of Orders'[Order Date])  
5 )
```

The 'Data' pane on the right shows the table's structure, including columns like Date, List of Orders, Order Details, Amount, Average Profit Delhi, Category, Category Type, Order Count, Order ID, Profit, Quantity, Revenue per Order, Sales Category, Sub-Category, and Sales target.

Table: Date Table (365 rows)

Data Model and DAX Implementation

The data model was prepared using multiple datasets. Calculated columns, measures, and a Date Table were created using DAX to support advanced business analysis and time intelligence calculations.

The screenshot shows the 'Data' pane in Power BI. The 'Date Table' is selected, and its columns are listed below it:

Date Table
> Date
> List of Orders
> Order Details

> Sales target

Sales Target Achievement by Category

Compare actual sales with sales targets.

Fields Used:

- Category
- Amount
- Target

Actual sales exceeded category targets, indicating strong business performance.

A Donut Chart was created to visualize the profit contribution of each product category. The chart shows that Clothing and Electronics contribute the majority of profit, while Furniture contributes a smaller share. This visualization helps identify the most profitable product categories.

Monthly Sales Trend

A Line Chart was created to analyze monthly sales performance. The visualization highlights sales fluctuations throughout the year, identifies peak and low-performing months, and supports trend analysis for business decision-making.

Profit by Sub-Category

A Clustered Bar Chart was created to compare profit across product sub-categories. The visualization identifies the most profitable and least profitable products, helping businesses focus on high-performing product segments.

Total Sales Amount and Target Cards

Profit Analysis

- Clothing generated the highest profit contribution.
- Electronics also showed strong profitability.
- Furniture contributed comparatively less profit.

Monthly Trend

- Sales fluctuated throughout the year.
- Peak sales observed in selected months.

Geographic Sales Analysis

A Map visualization was created to display sales performance by city. Bubble sizes represent total sales amounts, helping identify regions with strong and weak sales performance.

Sales Distribution by Sub-Category

A Treemap visualization was created to display sales distribution across different product sub-categories. Larger blocks represent sub-categories generating higher sales, helping identify major contributors to revenue.

Sum of Amount by Sub-Category

Order Count Analysis by State

A Funnel Chart was created to visualize order counts across different states. The chart highlights states generating the highest number of orders and helps identify regions with lower customer activity.

Order Count Analysis by State

This dashboard provides a complete analysis of e-commerce sales performance. It compares actual sales with targets, analyzes profit contribution across categories and sub-categories, tracks monthly sales trends, and identifies regional sales performance using map and funnel visualizations. The dashboard helps stakeholders monitor key business metrics and make informed decisions based on data-driven insights.

Descriptive Analytics

Descriptive analytics focuses on summarizing historical data to understand past business performance.

In This Project:

- Total Sales Amount Card
- Total Sales Target Card
- Monthly Sales Trend
- Profit Distribution by Category
- Order Count Analysis by State

The dashboard shows the total sales generated, profit earned, and order counts across different states. These visualizations help understand overall business performance and answer the question, "What happened in the business?"

Diagnostic Analytics – Why Did It Happen?

Diagnostic analytics helps identify the reasons behind business outcomes by analyzing relationships and patterns within the data.

In This Project:

- Profit by Sub-Category
- Profit vs Quantity Scatter Chart
- Sales Performance Matrix
- Geographic Sales Analysis

The dashboard helps identify which sub-categories generated higher profits and which regions contributed more sales. By comparing profit, quantity, and sales performance, we can understand why certain products or locations performed better than others.

Predictive Analytics – What Might Happen Next?

Predictive analytics uses historical data and trends to estimate future outcomes.

In This Project:

- Monthly Sales Trend
- Sales Target Comparison
- YTD Sales Analysis

By analyzing monthly sales patterns and comparing them with targets, businesses can forecast future sales performance and prepare strategies for upcoming months. Although advanced forecasting models were not used, trend analysis provides a foundation for future predictions.

Prescriptive Analytics – What Should Be Done?

Prescriptive analytics provides recommendations and actions based on analytical findings.

In This Project:

- Sales Target Achievement Analysis
- Profitability Analysis by Category
- Geographic Sales Analysis
- Order Count Analysis by State

The dashboard suggests focusing on high-profit categories such as Clothing and Electronics, improving performance in low-performing regions, and optimizing inventory for products with strong sales and profit margins. These insights support better business decision-making and strategic planning.

Project Conclusion

The project successfully transformed raw e-commerce data into an interactive Power BI dashboard. Through data cleaning, modeling, DAX calculations, and visualization

techniques, meaningful business insights were generated regarding sales performance, profitability, and regional trends.

The dashboard enables organizations to make informed decisions and improve overall business performance.

Thank You!
